Store your school once. Every request after that is one line.

A chatbot only knows what you type. This kit stores your calendar, criteria, standards, resources and house style in a folder your AI reads first, so a teacher can ask for **"lesson 3 of my Grade 7 forces unit"** and get something that fits how your school teaches. It works for **IB MYP** out of the box, and for **any other program** with your own framework.

The five layers

1 School
Calendar, unit shape, assessment, policies, house style. Entered once.

2 Curriculum
Criteria, standards, scope and sequence, textbooks. Per subject.

3 Resources
Rooms, equipment, materials, class sizes. What you actually have.

4 Generate
Unit, then lessons, then materials. One step at a time; you approve each.

5 Check
Rules every output must pass before you see it. Every mistake becomes a rule.

Three levels: start at 1

Level	What you get	What you need
1 · Folder	Your school in a folder your AI reads. Ask for a unit, lesson, worksheet, slides or rubric, built in steps and checked.	An AI tool you already use. Nothing to install.
2 · Folder + engine	A small program that runs every check automatically, tries the cheapest AI model first, logs every cent, and makes finished Word, PowerPoint and PDF files.	Docker Desktop and one AI API key. Setup walks you through both.
3 · School-hosted	The engine on a school server. One school layer; every teacher inherits it.	Your IT team, once Level 1 has worked for one course.

After today: three steps

1 Download the kit.
Open the link below → green **Code** button → **Download ZIP** → unzip.

2 Open the folder in your AI tool.
Claude Code, Codex, Cursor, Copilot or Gemini CLI. Browser chats work for Level 1.

3 Type `setup`.
Send it a photo of your setup sheet. It asks only what's missing.

Where you start, by role

You are	Start with	First win
Teacher	Level 1, one course. Skip Block B if your coordinator has done it.	One lesson you'd teach next week
Department head	Block C for your subject: verify the criteria once for everyone.	A checked framework and one agreed unit outline
Curriculum coordinator	Block B for the whole school, then one pilot department.	A school layer every teacher inherits
IT director	Shared folder, approved AI providers, then Level 2 on one machine.	A shared folder and a list of allowed providers
School leader	B1, B7, B9 and D6: calendar, policies, owner, budget.	A named owner and one pilot
Lab / resources	C7–C10 only.	An inventory the AI plans around, and an order list

Use only what you need: materials for units you already have (Blocks A–C), or a second opinion on your own work (`check this`).

The starter kit: `github.com/ariel-coder-maker/school-ai-starter`
Free. Folder structure, the guided setup, prompts for units, lessons, worksheets, slides and rubrics, a tested list of checks, and the optional engine. Ready-made IB MYP criteria names; a template for any other program.

Building your own from scratch

With or without the kit · any AI coding tool

You don't need the kit to build this. Your setup sheet is your specification: they hold everything the AI needs to know about your school. What follows is the design that made the kit work, as six rules and one prompt.

Six design rules, learned the hard way

1 Store it once, in files. Calendar, criteria, resources and style live in a folder the AI reads before every request. Requests stay one line long.

2 Make it in steps. Outline, then lessons, then assessment, approved one at a time. Rejecting an outline costs a minute; rejecting a finished unit costs the unit.

3 Every mistake becomes a check. Write each rule as one testable sentence. The AI runs every check before you see the work.

4 Never let it invent what must be real. Criteria, standard codes, textbook content and equipment come from your files, or they don't appear.

5 The cheapest model that passes the checks. The checks, not the price of the model, keep quality up. Swap models as they improve.

6 A person approves; no student data goes in. The AI prepares, a teacher decides. No names, grades or reports in the folder.

The prompt that starts it

Make an empty folder, open it in Claude Code, Codex, Cursor or similar, and give it this with a photo of your setup sheet:

```
Build a school curriculum assistant in this folder. Create START_HERE.md with the rules, and
folders 00_school, 01_curriculum, 02_sources, 03_resources, 04_prompts, 05_checks and 06_outputs.
Use my setup sheet (photo attached) to fill 00_school and 01_curriculum, and ask me one question
at a time about anything missing. Then write prompts that make a unit in steps (outline, lessons,
assessment), stopping for my approval at each step, and a checks file every output must pass
before I see it. Never invent criteria, standards or equipment: if it isn't in my files, ask.
```

Your first three checks

1	
2	
3	

Your next 30 days

Week 1	Week 2	Week 3	Week 4
Download the kit, or make the folder. Run `setup` for one course.	Make one unit outline and approve it. Make two lessons; teach one.	Turn every mistake into a check. Make the next lessons' materials.	Share the folder with one colleague. **Leaders:** name the layer's owner and a pilot department.

Guardrails: no student personal data in the folder · a teacher approves everything students see · the school owns the folder · use the AI providers your school's policy allows · never paste an API key into a chat.
